Chapter 1

Notes

17.04.2012 found nice program with GUI to look at hdf5 files and also to edit them, called **vitable**s - big files take very long to load but once loaded it runs smoothly
not clear why the **stages_52** simulation plots show such little star formation rate

16.04.2012 re-doing the rockstar jobs that did not work on intel queue now on the AMD machines (**stages_54dr5d5**)
512er run is being rockstarred on MACH (128 cores) faster than on our AMDs → quit job on astro-cluster

12.04.2012 Explicitly defining the ports when havin several server processes on the frontend did not seem to work for the intel queue, all three rockstar jobs stopped working after some time

04.04.2012 E-Mail correspondence with Sabine Kreidl to Rockstar on MACH
Recompiled Gadget with **PLACEHIGHRESREGION=1** on and **PMGRID** resolution of 256 for 256er run

03.04.2012 Tried nonperiodic Gadget boundary conditions → leads to star-like patterns

02.04.2012 Correspondence with Peter Behroozi concerning OpenMP parallelization possibilities in Rockstar → tried suggested loops and auto-parallelization. Jobs on intel machines freeze ...

27.03.2012 **512er_major_merger** Rockstar run is very slow even on 24 cores
consistenttree has parameter **BOX_DIVISIONS** which divides the box in this number cubed parts and makes **tree_X_Y_Z.dat** output and is very very fast this way → have to rewrite reading routine in Markus' converter

26.03.2012 Intel compiler auto-parallelization test runs on LEO3 for converter v0.5
 512^3 runs produced Segfaults with Markus' converter v0.4 → fixed

21.03.2012 2DO: change virial radius reading in galaxcicusStart.xml to false and let intern value powmes scripts, plotting scripts (spin, vrms)

20.03.2012 powemes installed

19.03.2012 NGenIC starting redshift test, if corrected initial z leads to lower star formation rate did show, that suspicion was not proven. Other explanation has to be found. Vrms and Spin videos are in the works.

14.03.2012 2DO: new stages simulations in Documentation (at least 46, 50, 51)
Script that makes *.pngs out of halo masses at all time steps is running over all simulations in r256 for comparison beweteen Bertschinger and NGenIC ICs
Rerun some Bertschinger ICs with updated linger.dat and spectral index $\neq 1$ to see how this influences star formation rate (linger runs and runs)

13.03.2012 Unclear why all NGenIC simulations show much higher star formation and plot scripts yield different output files though the same .xml file as always is used

11.03.2012 NGenIC_15039 produces "unreadable" output, is bein rerockstarred from scratch

```

```

09.03.2012 strange error in 2 galacticus jobs `stages_12` and `stages_13` → Markus' converter outdated with new consistenttrees?

idea: `drd5_r256_2` shows a major merger in progress → make a set of similar simulations with slightly different parameters

idea: make voids as constraints so that netto gravity is more centered towards over-densities

08.03.2012 add nohup to `./rockstar server_ib.cfg` in `qsubrockstar.sh` and rename `rocky_startscript` to something recognizable

| | | | | | | | |

re-galacticussing `NgenIC_15039` again since plotting scripts complain that there is no output for $a=0$

2DO: test speedup of galacticus with 1,2,4,8 threads

Rockstar works if infiniband is forced with `PARALLEL_IO_SERVER_INTERFACE = "ib0"`, the client IP address is indeed NOT necessary, client process is started with `auto-rockstar.cfg` Gadget recompiled with newest openmpi version → should use infiniband now

06.03.2012 submitted 4 jobs with same seed but different constraints parameters

Memory agglomeration fix also on cluster + email to developer

Wrote E-Mails to Rien de Weijgaert and Peter Behroozi

re-rockstarring `stages_21` on my machine pc122 → dumped due to memory

02.03.2012 re-galacticussing `NgenIC_15039` cause 200 output redshifts lead to > 30GB file + added luminosity output redshifts from Markus' .xml file

Peter answered and sent `consistent_trees v0.99`, but problem persists - suspicion:

Snapshotnames.dat must be changed (delete corresponding lines) for runs that have < 200 outputs!
 rockstar won't start any more ... network problem suspected

01.03.2012 wrote E-Mail to Peter concerning `find_parents_and_cleanup`:
`find_parents_and_cleanup.c:130` problem
 consistentree: NgenIC_15039, galacticussing
 restarted: `stages_21` rockstarred auf AMD-04
 first 512^3 simulation NgenIC_7755 finished successfully - lasted 1 day on 64 cores
 wrote E-mail to de Weijgaert concerning constrained ICs

29.02.2012 `stages_12` re-rockstarred auf AMD-03
`stages_21` rockstarred auf AMD-04 - crashed
 100Mpc 512^3 jobs: 11410, 15725, 27036, 7755
 10 100Mpc ICs generated
Note: try bigger volumes with NGen-IC
 added output redshifts derived from `gadget_timer.txt` as parameter `outputRedshifts` in .xml file
 Random seeds that do not create cluster like structures at 32Mpc box: 589, 12170, 13610, 16604, 16749, 17362, 17433, 29666, 32223, 17595, 22045, 3724, 3183, 4152, 7581, 8502, 10153, 10657, 22946, 14841, 25060, 29468, 32634
 Random seeds that look a little interesting: 15039 → rockstarred on AMD-03 (finished), 26214 → rockstarred on AMD-04

28.02.2012 Successfully started some N-GenIC jobs for comparison of IC generation

17.02.2012 Discussion with Asmus about Stages Cluster → try more systematic approach to ICs

15.02.2012 Galacticus revision 708 - `drd5_r256_2` not fixed → E-Mail to Andrew
 check tomorrow: Galacticus jobs `fuenfincr256_1` and `drdx_3_r256`
Note: think about / find a good method for common metadata

14.02.2012 Wrote E-Mail to Bertschinger.

13.02.2012 Deleted some jobs I started yesterday because they had artificial crosses or were practically unconstrained
 Third simulation `fuenfincr256_1` ran through - Galacticus restart worked well!
Note: IC with same seed but higher resolution do not yield the same simulation! → started two more test runs from r128 sims to doublecheck
 → Note from April 2012: different `linger.dat` suspected

12.02.2012 Updated Galacticus to revision 707 as suggested by Andrew and added parameter `hotHaloOutflowAngularMomentumAlwaysGrows` to xml file.
 Two of four simulations ran through (copied hdf5 to transfer), two crashed → try to continue at saved states!

10.02.2012 wrote E-Mail to Andrew about performance problems and wavelenght computation error in `fuenfincr256_1`
 started some runs with higher central delta and broader smoothing lenghts, i.e. $32/dx$ and $100/dx$; all 128 resolution except second last one (same seed!):

09.02.2012 drd5_r256 last written to hdf5 file feb 09, 05:07
 fuenfincr256_2 last written to hdf5 file feb 06, 03:28
 drd5_r256_2 last written to hdf5 file feb 07, 00:50

02.02.2012 drdx_h100_128_1 run has again severe consistency metric problem
 → not clear why
 upper python script does not work, was commented out again
 plan: **move to python scripts in general in order to have easier arithmetic calculations**
 plan: create new folder structure and remove old simulations → done

31.01.2012 note: h=70.3 in galacticus xml input file is expected, consistent tree obviously implies it
 → fixed: changed in markus parameter file for the converter and in xml file
 → question: why not read out?
 → python updateGalacticusStart.py from Markus

30.01.2012 new consistenttree with vmax=20

Chapter 2

Simulations

2.1 r128

2.1.1 drdx_3

ROCKSTARRED ✓

pfff → Error: too few halos at scale factor 0.926072 to calculate consistency metric.
